

My Experience in Creating a Portfolio Website

I had an interesting experience while creating my own portfolio website. Initially, I felt confused because this was the first time I was asked to create a portfolio independently. In the previous semester, I worked on collaborative projects in groups, so when I had to work alone, I felt hesitant about whether I could complete it well.

However, I tried to be more self-confident, and with the support of my parents and friends, my belief began to grow that I could definitely do it if I truly put in the effort. Before starting to build the website, I first designed the layout of the landing page. I looked for various references from platforms like TikTok and Pinterest, or sometimes Dribbble, and then tried to apply them to the design. I used Figma.

After the design was finished, I started developing the website using HTML, CSS, and a little bit of JavaScript. In the process, I often encountered difficulties, such as code that didn't run as expected or errors that left me confused. Despite that, I didn't give up. I kept searching for solutions on the internet—including utilizing technological assistance like ChatGPT to understand the mistakes and fix the code.

Throughout the process, I tried to stay consistent by working on it every day, even though I also had other tasks like making posters, doing assignments for other subjects, and making videos. As the deadline approached, I started to focus more and tried to manage my time well so that all tasks could be completed.

Finally, my portfolio website was successfully completed. I feel very proud and happy because I managed to get through a quite challenging process. This experience not only improved my web development skills but also trained my patience, perseverance, and self-confidence. This experience also motivates me to keep learning and developing my skills in the future.
